## PART 1

## General Provisions

Section I. Definitions

## 1. Frequency Allotment Plan

A plan which shows the frequencies to be used in particular areas or by particular countries, without specifying the stations to which the frequencies are to be assigned.
2. The terms to express the different methods of frequency distribution as used in this Appendix have the following meanings :

| Frequency <br> distribution to: | French | English | Spanish |
| :---: | :---: | :---: | :---: |
| Services | Attribution <br> (attribuer) | Allocation <br> (to allocate) | Atribución <br> (atribuir) |
| Areas | Allotissement <br> (allotir) | Allotment <br> (to allot) | Adjudicación <br> (adjudicar) |
| Stations | Assignation <br> (assigner) | Assignment <br> (to assign) | Asignación <br> (asignar) |

3. A Major World Air Route is considered to be a long-distance route, made up of one or more segments, essentially international in character, extending through more than one country and requiring long-distance communications facilities.
4. A Major World Air Route Area (MWARA) is an area embracing a certain number of Major World Air Routes, which generally follow the same traffic pattern and are so related geographically that the same frequency families may logically be applied.
5. Regional and Domestic Air Routes are all those using the Aeronautical Mobile (R) Service not covered by the definition of Major World Air Routes in paragraph 4 above.
6. A Regional and Domestic Air Route Area (RDARA) is one embracing a certain number of the air routes defined in the foregoing paragraph.

## 7. Family of Frequencies in the Aeronautical Mobile Service

A group of frequencies selected from different aeronautical mobile bands in such a way as to permit communication, at any time and over any distance, between aircraft in flight and appropriate aeronautical stations.

Section II. Technical and Operational Principles used for the Establishment of the Plan of Allotment of Frequencies in the Aeronautical Mobile (R) and (OR) Services

## A. Determination of Channel Width

## 1. Frequency Separation

The frequency separations adopted are adequate to permit high capacity means of communication, as indicated in the following table:

| Band <br> $(\mathrm{kc} / \mathrm{s})$ | Separation <br> $(\mathrm{kc} / \mathrm{s})$ | Band <br> $(\mathrm{kc} / \mathrm{s})$ | Separation <br> $(\mathrm{kc} / \mathrm{s})$ |
| :---: | :---: | :---: | :---: |
| $2850-3155$ | 7 | $8815-9040$ | 8.5 |
| $3400-3500$ | 7 | $10005-10100$ | 9 |
| $3900-3950$ | 7 | $11175-11400$ | 9.5 |
| $4650-4750$ | 7 | $13200-13360$ | 10 |
| $5450-5480$ | 7.5 | $15010-15100$ | 10 |
| $5480-5730$ | 7.5 | $17900-18030$ | 10 |
| $6525-6765$ | 7.5 |  |  |

a) It is assumed that A3 modulation frequencies will be limited to 3000 cycles per second and that the sideband radiation of other authorized emissions will not exceed that of A3 emissions.
b) The use of channels as derived from the above table, for the various classes of emissions (A1, A2, A3, A4 and F1), will be subject to special arrangements by the administrations concerned in order to avoid the interference which may result from the simultaneous use of the same channel for several classes of emission, no inherent priority being given to any particular class of emission.
c) It is recognized that two or more Al channels can be derived from each of the channels provided under this frequency separation plan.
d) The grouping of adjacent channels derived from the above table to permit the satisfaction of particular requirements, will be subject to special arrangements by the administrations concerned.
e) The arrangements contemplated in $b$ ) $c$ ) and $d$ ) above should be made under the provisions of Article 43 (Special Agreements) of the International Telecommunication Convention and Article 4 of the Radio Regulations.

## 2. Frequencies to be allotted

The list of the frequencies to be allotted in the exclusive aeronautical mobile bands, on the basis of the frequency separation provided for under paragraph 1 above, will be found in the table opposite.

## 3. Channels Common to ( $R$ ) and (OR) Services

The channels common to the (R) and (OR) services, centered at 3023.5 and $5680 \mathrm{kc} / \mathrm{s}$, are authorized for use world-wide as shown in Part II of this Appendix.

Notwithstanding those provisions of the Allotment Plan set forth in Part II hereof, the frequency $5680 \mathrm{kc} / \mathrm{s}$ may also be used at aeronautical stations for communication with aircraft stations when other frequencies of the aeronautical stations are either unavailable or unknown. However, this use shall
kc/s

* Available for A1 emission only.
** It is necessary that only equipment having a high degree of stability be used on this channel.
be restricted to such areas and conditions that harmful interference cannot be caused to other authorized aeronautical uses.

4. The International Civil Aviation Organization (I.C.A.O.) co-ordinates aeronautical (R) communications with international air operations for a large part of the world and this organization should be consulted in appropriate cases, particularly in the operational use of the frequencies in the Plan.

## 5. Adaptation of Allotment Procedure

It is recognized that all the sharing possibilities have not been exhausted in the allotment plans contained in this Appendix. Therefore, in order to satisfy particular operational requirements which are not otherwise met by these allotment plans, Administrations may assign frequencies from the HF aeronautical mobile bands in areas other than those to which they are allotted in the said plans. However, the use of the frequencies so assigned must not decrease the protection to the same frequencies in the areas where they are allotted by the plans below that determined by application of the procedure defined in Part I, Section II B and Part III, Section II, paragraph 4 (d) of this Appendix for the (R) and (OR) Services respectively.
6. When necessary to satisfy the needs of international air operations Administrations may adapt the allotment procedure for the assignment of aeronautical mobile ( R ) frequencies, which assignments shall then be the subject of prior agreement between Administrations affected.
7. Resort to the co-ordination described in paragraph 4 shall be made where appropriate and desirable for the efficient utilization of the frequencies in question.
8. In addition to the extensions provided for in this Appendix for certain frequencies of MWARA's EU and ME to cover the requirements of international aircraft flights to and from U.S.S.R. territory, this Administration may use, for the same purpose, the frequencies allotted to RDARA's 2 and 3 and sub-RDARA's thereof. Such uses, however, must not decrease the protection below the standards mentioned in paragraph 5 above for all stations of the aeronautical mobile service.

## B. Interference Range Contours

## 1. Definition of Contours

The transparencies inserted in the pocket at the end of this Appendix show contours which indicate the minimum acceptable distance separating two ground stations of 1.0 kW radiated power (unmodulated) for the frequencies stated and for producing a protection ratio of 15 db of desired signal to interfering signal on the same frequency at an aircraft operating at the limit of the service range of the desired ground transmitter.

The service range is not included in the contour.

## 2. Type of Map Used

These transparencies can be used only on a Mercator's projection world map of the scales given on each transparency, and will not be suitable for use on any other scale of Mercator's projection or any other projection. The world maps accompanying this Appendix, depicting RDARA and MWARA boundaries, are to the correct scale and the transparencies carrying the interference range contours can be directly used on these maps.

## 3. Change of Scale or Projection

Should any other Mercator scale be desired, then, by using the co-ordinates given in the tables shown below, new interference range contours can be drawn to fit the new scales.

It must be remembered that when the new transparencies are constructed, the intersection of the vertical line of symmetry, i.e. the meridian of longitude and the horizontal line of latitude should be at $00^{\circ}$ latitude for the $00^{\circ}$ contour, $20^{\circ} \mathrm{N}$ for the $20^{\circ}$ contour, $40^{\circ} \mathrm{N}$ for $40^{\circ}$ contour, etc.

The co-ordinates shown in the above-mentioned tables are given with reference to the $180^{\circ}$ meridian taken as the axis of symmetry for the construction of the contours.

## 4. Sharing Conditions Between Areas

The transparencies were constructed on the basis of sharing conditions agreed at the International Administrative Aeronautical Radio Conference (I.A.A.R.C.) of 1948-1949, namely:

| Areas | Mc/s | Sharing Conditions |
| :---: | :---: | :---: |
| MWARA to MWARA | $\begin{aligned} 3 & -6.6 \\ 9 & -11 \cdot 3 \\ 13 & -18 \end{aligned}$ | night propagation <br> day propagation <br> time separation <br> Note: $6.6 \mathrm{Mc} / \mathrm{s}$ and $5.6 \mathrm{Mc} / \mathrm{s}$ sharing conditions considered the same |
| MWARA to RDARA | $\begin{aligned} & 3-5 \cdot 6 \\ & 6 \cdot 6-11 \cdot 3 \\ & 13-18 \end{aligned}$ | night propagation day propagation time separation |
| RDARA to RDARA | $\begin{aligned} 3 & -4.7 \\ 5.6 & -11.3 \\ 13 & -18 \end{aligned}$ | night propagation day propagation time separation |

The additional contours for day included for $3 \mathrm{Mc} / \mathrm{s}, 3.5 \mathrm{Mc} / \mathrm{s}$ and $4.7 \mathrm{Mc} / \mathrm{s}$ are for determining daylight sharing possibilities.

The material in " Minimum and Maximum Range Charts for Use as a Guide to the Allotment of Frequencies " Annex 1 to Volume 1 of the Report of the First Session of the I.A.A.R.C. (Geneva, 1948) was used in the preparation of the allotment plan.

## 5. Method of Use

Take the MWARA or the RDARA maps accompanying this Appendix and select the transparency for the frequency order and sharing conditions under consideration.

Place the centre of the transparency (i.e. the intersection of the axis of symmetry and the latitude line) over the boundary of the area or at the location of the transmitter. Note the latitude of this point and select the contour corresponding to this latitude.

A transmitter located at any point outside the contour will result, as defined in paragraph 1 above, in a protection ratio of better than 15 db .

Any transmitter located at a point inside the contour will result in a protection ratio of less than 15 db .

For the Northern Hemisphere, the contours should be used in their natural position as published, but for the Southern Hemisphere, the transparency should be inverted. This point should be carefully observed when following the boundaries of the areas which involve the transition of the equator.

## Section I

Description of the MWARA, RDARA and Sub-RDARA Boundaries *

1. The boundary descriptions which follow cover the areas to which frequencies are allotted under the frequency Allotment Plan of the Conference.
2. These areas are also shown graphically on maps attached hereto.

If there is any difference between the area as shown on the maps and as described, the written description is to be considered correct.
3. National boundaries used in the written descriptions are those of September, 1949.
4. In the description of the Major World Air Route Areas (MWARA's) all lines between points not otherwise specified are defined as great circles.

In the descriptions of the Regional and Domestic Air Route Areas (RDARA's) and Sub-Areas lines not otherwise specified are defined as straight lines on a Mercator Projection Map.

## ARTICLE 2

## Frequency Allotment Plan (per numerical order of frequencies)

General Notes: (1) Class of stations: FA
Types of emission: A1, A2, A3, A4 and F1
Power (unless otherwise indicated):

| A1 emissions: <br> Ground station | 1.0 kilowatt radiated (peak), <br> Aircraft |
| :--- | :--- |
| 50 watts radiated (peak). |  |
| A3 emissions: |  |
| Ground station | 4.0 kilowatts radiated (peak), $100 \%$ modulated, <br> Aircraft |

Hours: H 24 unless otherwise indicated.
(2) A frequency allotted on "day-time basis" may be used on a secondary basis during the period one hour after sunrise to one hour before sunset when the identical channel is allotted on a primary basis to Major World Air Route Areas, Regional and Domestic Air Route Areas, or Sub-Regional and Domestic Air Route Areas which receive full protection during the twenty-four hours. The use of frequencies on a secondary basis is subject to there being no interference with the primary allotment.
(3) A " shared channel " is a channel allotted in common to adjacent areas within interference distance of each other and its use is subject to agreement between the administrations concerned.

## PART III

## Technical and Operational Principles for the Allotment of Frequencies for the Aeronautical Mobile (OR) Service

Section I. Available Frequency Bands and Channels

1. Bands.

The frequency bands available to the (OR) service fall into three distinct categories, i.e.,
a) bands allocated exclusively to the aeronautical mobile (OR) service,
b) bands which specifically provide for the aeronautical mobile (OR) service, but which are shared with other services, and
c) bands for the general mobile services, from which the aeronautical mobile (OR) service is not specifically excluded.
2. Assignable Frequencies.
A. Exclusive Bands.

The frequencies for the bands allocated exclusively to the aeronautical mobile (OR) service are indicated in Part I.
B. Shared Bands.

The channels proposed for allotment to the (OR) service in the shared bands have the same separation as those in the exclusive bands. No specific frequencies were recorded, however, for these shared band channels. The numbers of (OR) allotments proposed in the shared bands were assessed primarily on the basis of the size of the bands and the number of services sharing them.
C. Channels Common to (R) and (OR) Services.

The channels common to the (R) and (OR) services, centred at 3023.5 and $5680 \mathrm{kc} / \mathrm{s}$ are authorized for world-wide use as laid down in No. 3 of Section II of Part I.
3. Selection of Frequencies.
A. Exclusive Bands.

Requirements including those common to more than one region were, to the limit of the spectrum space available, accommodated in the bands allocated exclusively to the (OR) service on a world-wide basis. Excess requirements in respect of Region 1 were met, as far as possible, from the band 3900 to $3950 \mathrm{kc} / \mathrm{s}$ allocated exclusively to the (OR) service in that region.
B. Shared Bands.

The balance of the requirements was accommodated to the maximum extent in the bands mentioned in Nos. 1b) and 1c) of Section I in that order of preference.

## Section II. Adaptation of Technical Principles

## 1. Division of Channels.

In order to utilize the bands more efficiently, it is considered that one A3 channel is capable of satisfying requirements for either one A3, or two or more A1, A3A, or other complex types of transmission. Where a channel is subdivided the partial channels are not to be used by different administrations. In employing the additional channels so derived due care must be exercised to avoid harmful interference to the users of adjacent channels.

## 2. Modification of Class of Emission.

In view of the necessity on the one hand to avoid harmful interference, and on the other hand to use the spectrum space to its full capacity, changes from one type of emission to another are permissible in those cases where no additional band space is thereby occupied.

## 3. Allotment of Adjacent ( $O R$ ) Channels.

Where a country so desired, the allotments to that country were assembled into contiguous channels where geographical considerations permit and where otherwise practicable.

## 4. Protection Ratios and Sharing.

a) In areas where it was found necessary to secure a greater repetition of assignments, the same frequency has been allotted to more than one requirement of an administration even though this may result in a reduction of the protection ratio between the emissions of the stations concerned.
b) In certain areas where peaks of requirements occur, protection ratios may be lowered by agreement between the countries concerned.
c) Certain assignments have been repeated where there is a strong probability of interference between stations of different administrations. This was done in the belief that the working time of any one of the stations so treated would be intermittent. In these cases each station has an equal right to use the frequency, and no one station or group of stations is given priority.
d) A number of frequencies were assigned on a " secondary" basis. In such cases, a station having the use of a frequency as a " primary " assignment is protected from any other station using the same frequency as a " secondary " assignment by the following provisions:

- a station using a frequency on a secondary basis must be inferior in power to the station operating on a primary basis,
- such a station must be distant from the station operating on a primary basis by not less than half of the repetition distance required for a protection ratio of 20 db .

5. Limitation of Power.

The interested administrations should agree on a reduction in aeronautical station radiated power at night to the extent necessary to make possible night-time use of these frequencies.
